DEPLOYMENT EVALUATION

Analysis and Interpretation Document

Kasama Support Hub Management System

Project Name	Kasama Support Hub Management System
Developer	Mike Laurence A. Dela Cruz
Beneficiary / Client	Coach Hannah / Kasama Support Hub Department
Deployment Date	March 2026
Submission Date	March 02, 2026

Prepared by:

Mike Laurence A. Dela Cruz

System Developer

Kasama Support Hub Management System

SECTION 1: RAW EVALUATION DATA

This section contains the scores from the ISO 25010:2023 evaluation form filled out by Coach Hannah during the deployment meeting.

1.1 Evaluation Score Summary

Table 1. Summary of Scores per ISO 25010:2023 Quality Characteristic

Quality Characteristic	Items	Total Score	Average	Interpretation
1. Functional Suitability	3	14	4.67	Extremely Acceptable
2. Performance Efficiency	3	15	5.00	Extremely Acceptable
3. Compatibility	2	10	5.00	Extremely Acceptable
4. Interaction Capability	8	38	4.75	Extremely Acceptable
5. Reliability	4	19	4.75	Extremely Acceptable
6. Security	6	28	4.67	Extremely Acceptable
7. Maintainability	5	21	4.20	Very Acceptable
8. Flexibility	4	20	5.00	Extremely Acceptable
9. Safety	5	20	4.00	Very Acceptable
OVERALL WEIGHTED MEAN			**4.67**	**Extremely Acceptable**

Note: Overall Weighted Mean = Sum of all characteristic averages ÷ 9. Scale reference below.

Scale	Range	Verbal Interpretation
5	4.50 – 5.00	Extremely Acceptable
4	3.50 – 4.49	Very Acceptable
3	2.50 – 3.49	Moderately Acceptable
2	1.50 – 2.49	Slightly Acceptable
1	1.00 – 1.49	Unacceptable

1.2 Beneficiary's Open-Ended Responses

Question 1: Can the system be improved?

Coach Hannah answered YES and gave four specific suggestions:

- Add an attachment feature for the follow-up concern module.
- Add a student profile with year level classification (1st to 4th year) upon registration.
- Add a dedicated profile page for Coach Hannah.
- Improve the overall CSS and visual design of the system.

Question 2: Challenges Encountered:

No challenges were encountered. Coach Hannah was able to navigate the system without any difficulty during the demo.

Question 3: Other Suggestions:

No additional suggestions. Her suggestions are the same as what she answered in Question 1.

SECTION 2: DATA ANALYSIS

This section goes through each quality characteristic and explains what the scores mean for the system.

2.1 Analysis by Quality Characteristic

Functional Suitability | Average: **4.67** | **Extremely Acceptable**

The system scored 4.67 here, which falls under Extremely Acceptable. Items 1.2 and 1.3 both got 5, meaning the system gives correct results and the functions are appropriate for what Coach Hannah needs. Item 1.1 got a 4 because the system is not yet fully complete — some features like the attachment option in follow-ups and the student year-level profile are still missing. These are Coach Hannah's suggestions and will be added in the next update.

Performance Efficiency | Average: **5.00** | **Extremely Acceptable**

All three items got a 5, giving this a perfect score of 5.00. The system responded quickly, processed inputs without delay, and did not show any resource issues during the demo. This is a good sign that the backend is running efficiently and can handle the number of users it is built for.

Compatibility | Average: **5.00** | **Extremely Acceptable**

Both items got a 5, making this a perfect score of 5.00. The system does not interfere with other tools and can exchange data properly. Since it is a standalone web application, this result makes sense — it runs on its own without depending on other systems.

Interaction Capability | Average: **4.75** | **Extremely Acceptable**

This area got an average of 4.75. Six out of eight items received a perfect score, including Learnability, Operability, User Error Protection, Inclusivity, User Assistance, and Self-Descriptiveness. The two items that got a 4 were Appropriateness Recognizability (4.1) and User Engagement (4.5), both of which are related to how the system looks and how inviting it feels to use. Coach Hannah's feedback about improving the CSS directly matches these two lower scores.

Reliability | Average: **4.75** | **Extremely Acceptable**

Reliability scored 4.75. Availability, Fault Tolerance, and Recoverability all received a 5, meaning the system stays up, handles errors properly, and recovers well from interruptions. The only 4 was on Faultlessness (5.1), which is expected since the system has not been fully deployed yet and is still being refined.

Security | Average: **4.67** | **Extremely Acceptable**

Security got an average of 4.67. Four out of six items scored a 5 — Confidentiality, Integrity, Accountability, and Authenticity. The two that got a 4 were Non-repudiation (7.3) and Resistance (7.6). Non-repudiation scored 4 because the system's logging features are functional but not yet fully detailed. Resistance scored 4 because while the system handles normal security well, it has not been stress-tested against hostile attacks yet — something that will be addressed during deployment setup.

Maintainability | Average: **4.20** | **Very Acceptable**

This is the lowest-scoring area at 4.20, rated as Very Acceptable. Modularity, Reusability, Analysability, and Modifiability all got a 4. This honestly reflects the current state of the code — it works, but the components are still tightly connected and need to be refactored into cleaner, more separate modules. Testability (8.5) got a 5 since the system's functions can be clearly tested. The planned refactoring work will directly improve this area before deployment.

Flexibility | Average: **5.00** | **Extremely Acceptable**

All four items got a 5, making this a perfect score of 5.00. The system can run in different environments, be set up and removed cleanly, and is built to handle more users and data as time goes on. This is important since the system needs to support Coach Hannah and her growing number of students long-term.

Safety | Average: **4.00** | **Very Acceptable**

Safety is a new characteristic added in ISO 25010:2023, and the system scored 4.00 across all five items. This means the system handles safety-related aspects adequately — it operates within safe parameters, can identify risks, and integrates without introducing hazards. The consistent score of 4 across all items suggests these features are working but still have room for improvement, especially as the system gets closer to handling real student data in a live environment.

SECTION 3: INTERPRETATION AND INSIGHT

3.1 Overall System Performance

The Kasama Support Hub Management System has an Overall Weighted Mean of 4.67, which is interpreted as Extremely Acceptable. This was computed by averaging the nine characteristic averages, giving each quality area equal weight regardless of how many items it has.

Out of the nine characteristics, five reached a perfect score of 5.00 — Performance Efficiency, Compatibility, Flexibility, and two others close to it. Only Maintainability fell below 4.50 with a score of 4.20. No area scored below a Very Acceptable rating, which means there are no critical failures in the system. Overall, the result shows that the system is in good shape and ready to move forward once the remaining improvements are completed.

3.2 Strengths of the System

Based on the evaluation results, here are the top three areas where the system performed best:

1. Performance Efficiency — 5.00 (Extremely Acceptable)

The system loaded fast and responded quickly throughout the entire demo. Coach Hannah did not experience any delays when navigating pages, submitting data, or viewing the analytics dashboard. This is a result of keeping the backend simple and the database queries efficient, which directly meets the performance targets set in the requirements.

2. Compatibility and Flexibility — 5.00 (Extremely Acceptable)

Both of these areas received perfect scores. The system runs without interfering with other tools, can be set up in different environments, and is built to grow as more students and concerns are added. This confirms that the decision to build it as a standalone web application was the right call for Coach Hannah's setup.

3. Reliability — 4.75 (Extremely Acceptable)

Availability, Fault Tolerance, and Recoverability all got perfect scores. The system stays accessible, handles unexpected errors without crashing, and can restore its state after an interruption. This is important since students may submit concerns at any time, including outside office hours.

3.3 Weaknesses and Areas for Improvement

The following areas had the lowest scores and will be prioritized in the next update:

1. Maintainability — 4.20 (Very Acceptable)

This is the lowest-scoring area. Four out of five sub-characteristics got a 4, which reflects that the codebase is functional but still needs to be reorganized into cleaner, more independent modules. This is a known issue and the refactoring plan already covers it as a high-priority task.

2. Safety — 4.00 (Very Acceptable)

All five Safety items got a 4. The system handles safety adequately but has not yet been tested in a live environment where real threats and edge cases can occur. Strengthening the fail-safe mechanisms and integration safeguards is part of the deployment preparation plan.

3. Functional Suitability — 4.67 (Extremely Acceptable)

While still a strong score, the 4 on Functional Completeness reflects the features that are still missing based on Coach Hannah's feedback — specifically the attachment support, student year-level profile, and coach profile page. These are straightforward additions that will be implemented before the final deployment.

3.4 Connection to Software Design Principles

The perfect Performance Efficiency score confirms that keeping the backend lightweight — plain PHP and MySQL without heavy frameworks — was the right choice. The system stays fast even on slower mobile connections, which matters since most students access it on their phones.

The high Interaction Capability scores, especially on Learnability and Operability, show that the focus on simple navigation, clear labels, and color-coded statuses worked. Coach Hannah was able to use the system on her own after just a short walkthrough, which was one of the main usability goals.

The lower Maintainability score is an honest trade-off. During development, the priority was to get all the required features working correctly. Now that the functional side is done, the next step is to clean up and restructure the code so it is easier to update and maintain going forward.

The Security results show that the basic protections — authentication, role-based access, and data confidentiality — are working well. The lower scores on Non-repudiation and Resistance are expected at this stage and will be addressed as part of the deployment configuration.

SECTION 4: NEXT STEPS AND ACTION PLAN

This section lists the specific things that will be done before the system goes live, based on Coach Hannah's feedback and the evaluation results.

4.1 Feedback-Driven Improvements

#	Feedback	Planned Action
1	Add an attachment feature in the follow-up concern module.	Implement file upload support in the Follow-up module (FR5) so students can attach images or files alongside their follow-up comments.
2	Add a student profile with year level (1st–4th year) upon registration.	Update the registration form to include year level. Add a year-level filter in Coach Hannah's dashboard for easier sorting.
3	Add a dedicated profile page for Coach Hannah.	Create a Coach Profile page where Coach Hannah can view and update her account details and notification preferences.
4	Improve the overall CSS and visual design.	Revise the UI styling for consistency — fix spacing, fonts, colors, and button styles across all pages of the system.

4.2 Technical Improvements (Refactoring and Deployment)

On top of Coach Hannah's feedback, these technical tasks also need to be done before the system is ready for live use:

#	Area	Plan	Priority
1	**Deployment Configuration**	Set up environment config files (.env), configure the production server, and prepare database migration scripts before going live.	**High**
2	**Modularity Refactoring**	Separate tightly connected components into cleaner, independent modules — especially in the concern handling and notification logic.	**High**
3	**CSS and UI Cleanup**	Standardize fonts, spacing, and colors across all pages based on Coach Hannah's feedback.	**Medium**
4	**Attachment Feature**	Add file upload support to the follow-up module with server-side file type and size validation.	**Medium**
5	**Student Year Level Profiling**	Update registration to capture year level and add a year-level filter in the coach dashboard.	**Medium**

High priority items will be done first. Once everything is complete, the system will go through another round of testing with Coach Hannah before the final deployment.
